Kigali Pizza Assistant: Streamlit demo

The Week 9 hybrid chatbot as a web page. Three files go together in one public GitHub repository: `app.py`, `requirements.txt` and `intent_classifier.joblib`.

1. Create a public repository and upload the three files.
2. Go to share.streamlit.io and sign in with GitHub.
3. Create app, then choose the repository, the branch `main` and the main file `app.py`.
4. Deploy. The first start installs the libraries and the spaCy model: a few minutes.

The classifier was trained with scikit-learn 1.8.0; requirements.txt pins that version so it loads the same way. Never put a bot token or an API key in the repository: Streamlit has its own Secrets box (app settings).
